North American Birds
A QUARTERLY JOURNAL OF ORNITHOLOGICAL RECORD PUBLISHED BY THE AMERICAN BIRDING ASSOCIATION

VOLUME 69: NO. 3, 2016 • MARCH THROUGH MAY 2015
May. Greater White-fronted Geese were reported from seven counties through 31 May. An ad. blue-morph Snow Goose with 15 white morphs at the Sacramento N.W.R., Glenn 16 May was apparently the second-latest for the n. C.V. (ph. Steve Nord). A Ross’s Goose lingering around Mountain View through 25 May (Eric Goodill, MMR, MJM) tied the late date for Santa Clara, and Cackling Geese were reported from four counties through 29 May. A Brant at the Salinas WTP, Monterey 14 May (KVV) was notable for its slightly inland location. Eurasian Wigeon in six counties through 31 May likewise represented more lingering birds than expected and included the latest for the n. C.V. at the Sacramento N.W.R., Glenn 18 May (Bob MacMillan). Six Eurasian Teal were reported in five counties through 23 Apr. Male Tufted Ducks continued at Stafford Lake, Marin through 9 Mar (ph. Kevin Kerr, Donna Bray) and Lake Hennessey, Napa through 21 Mar (m.ob.), another was found at Abbotts Lagoon, Marin 24 Apr (Tate Snyder, AJ et al.). An unidentified eider was seen off Pigeon Point, San Mateo 13 May (RSTh). Of 3 Long-tailed Ducks, the latest was a lingering male at the Pajaro Dunes, Santa Cruz 6-9 May (NLv et al.). A female Hooded Merganser was on eggs in a nest box at Essex Pond, Humboldt 23 Apr (Julie Feucht); another female along the Tuolumne River 16 May (HMR) raised thoughts of a possible first breeding record in Stanislaus. Inland Red-breasted Mergansers were found at Lake Camanche, Amador 13 Apr (DMr) and Crowley Lake, Mono 17 May (LKh).

**LOONS THROUGH PELICANS**

Red-throated and Pacific Loons are annual (albeit in low numbers) inland in early spring, but up to 2 Red-throated Loons at Lexington Reservoir 3-22 May (ph. Stephen Peterson et al.) provided Santa Clara’s first May record, and a Pacific Loon at June Lake, Mono 23 May (ph. Phil Carmehl) was similarly late. Few Horned Grebes lingered past Apr, so up to 3 at Alviso, Santa Clara 3-9 May (MMR, Gena Zolotar) and one at the Pajaro River, Santa Cruz 16 May (ph. Aaron Gabbe, Craig Fosdick) were notable. Santa Clara’s wintering Red-necked Grebes at Calero Reservoir and Coyote Reservoir lingered through 9 Mar and 13 Apr, respectively (RPPh, Andy Bradshaw, PLD, EFe et al.), but one at Lexington Reservoir 3-17 May (ph. Stephen Peterson et al.) was quite tardy. Dorris Reservoir hosted Madox’s second Red-necked Grebe 1-2 May (ph SCR, JLx).

Laysan Albatrosses were well represented offshore, with a high of 9 seen from a repositioning cruise between Monterey and Mendocino 20 Mar (JCS, Tom Crabtree et al.). Even more exciting were the high numbers of Murphy’s Petrels observed. Three off Sonoma 20 Mar (PEL, Nick Lehaby et al.) furnished a first county record. From late Apr through May, double-digit counts were recorded on nine days, with highs of 68 between Monterey and Mendocino 27 Apr (Nathan Hentze), 63 from Mendocino to Del Norte 7 May (PEL, Gary Nunn, JCS, Monte Taylor et al.), and 54 in the vicinity of Davidson Seamount, Monterey 6-8 May (ADS et al.). The second record for Fl. was recorded 30 May (Edward Jenkins). Twenty-two Hawaiian Petrels were recorded on these cruises 20 Mar-13 May, with a high of 9 off Mendocino and Humboldt 7 May (PEL, Gary Nunn, JCS, Monte Taylor et al.). Fewer Cook’s Petrels were reported on repositioning cruises, with 17 seen on four dates 20 Mar–13 May, but 145 were seen on a research vessel 6-8 May around Davidson Seamount, Monterey (ADS et al.). The difficulty of distinguishing Short-tailed Shearwaters from Sooties clouds our understanding of typical departure dates of the former, but it appears that only a few linger into Mar (and possibly early Apr). Two seen from shore at the entrance to Humboldt Bay, Humboldt 9 Mar (RBF) were therefore noteworthy. The tail end of last winter’s Black-vented Shearwater incursion provided the first spring record for S.F. in a decade, with 2 at Lands End 10 Mar (Collin Adams, Amanda Starbuck). Single Wedge-rumped Storm-Petrels mist-netted at Fl. 19 Apr and 20 May (ph. Point Blue) provided the fourth and fifth Regional records and the northermmost records to date, the previous three were from Monterey Bay. This species has typically been recorded off California only during warm-water conditions, and these records further exemplify the influx of southern seabirds that accompanied warmer water last winter. The significance of these records was eclipsed by California’s second Tristram’s Storm-Petrel, which was found dead (likely the victim of Burrowing Owl predation) at Fl. 18 Mar (ph. Point Blue); the first was also at Fl., on 22 Apr 2006. A Blue-footed Booby at Fl. 22-24 Apr (Point Blue) provided a rare spring record, but one at the Klamath River mouth 20 Apr (SMCa), furnishing Del Norte’s second record, was far less expected so far north. Twenty-nine Brown Boobies more than doubled our previous spring total. At least 18 were at Fl., with high counts of 12 on 2 or 19 Mar (Point Blue); numbers there dwindled in Apr and early May but were bolstered by a few arrivals later in May Elsewhere, 2 were in Monterey, 3 in San Mateo, 2 in S.F., 2 in Marin, and one in Humboldt. The Northern Gannet, now present for three years, was seen at Fl. most days (Point Blue), was detected around Alcatraz Island and the Golden Gate Channel, S.F. on a number of occasions.
23 Apr+ (m.ob.), and provided San Mateo’s first record at Daly City 25 May (P.Sar). A Brandt’s Cormorant at Richmond 19 Apr (LKh, EPi, JHoppes) provided one of few recent spring records for Contra Costa, while a Pelagic Cormorant at Alviso, Santa Clara 30 May (MDo) may have been the same bird observed at this location sporadically over the past eight winters. The wintering American White Pelican wandered around coastal Humboldt and Del Norte until 21 Apr (m.ob.). A Brown Pelican was unusual (especially in spring) as far inland as Davis, Yolo 12 May (Susan Nishio).

BITTERNS THROUGH CRANES

Least Bitterns were reported in above average numbers. Two were at Las Gallinas, Marin 16-18 May (Mark Dettingel, Megan Elrod, Daphne Hatch), and up to 2 were at Campbell Cove, Sonoma 24 May+ (PBC, Mike Bumgarner, DN, m.ob.). Birds to Yolo Bypass W.A., Yolo 6 May+ (m.ob.), another was at the Cache Creek Conservancy, Yolo 16-20 May (Brent Campos et al.), and 4 were found at three locations in Sacramento 11-24 May (m.ob.). A little Blue Heron courting a Cattle Egret at Auburn, Sonoma 25 May (Sarah Mayhew) was likely a returning bird but remained only a single day this year, unlike last summer when it spent 22 Jun–7 Jul at the same location. Up to 2 Cattle Egrets continued from winter through 16 Apr near Fort Dick, Del Norte (ADB).

Marin’s Black Vulture continued in Bolinas through 10 May (RDig, Alex Merritt, m.ob.). Another n. of Pacific Valley 14 May (?)Greg Smith), providing the first record for Monterey, was deemed by the C.B.R.C. to be the same as a bird that has wandered the coast from Ventura to San Luis Obispo since 2009. A White-tailed Kite at Willow Creek W.A. 4 Mar (Peter Young, Jim Moore) was a rare find for Lassen. A Bald Eagle nest at Gallighan Slough held 2 young 6 Mar; both successfully fledged in early Jun, for the second successful nesting for this site and Santa Cruz. Hawkwatching from San Francisco on warm days with light to moderate offshore winds turned up 7 Broad-winged Hawks 18 Apr–3 May (HuC, DMO, m.ob.) and 2 Swainson’s Hawks 30 Apr (HuC et al.). Both species were regarded as casual spring migrants prior to the recent regular monitoring of hilltop observation points. Further south, northbound ad. Broad-wingeds were seen over Belmont, San Mateo 18 Apr (RSTh) and over Loma Prieta 19 Apr (second spring record for Santa Cruz and fifth for Santa Clara; ph Pete Sole, DwBw et al.). Migrant Swainson’s Hawks were seen over Belmont, San Mateo 25 & 27 Apr (both RSTh), over Quail Hollow Ranch, Santa Cruz 26 Apr (ph. AMR), and over Harksins Slough, Santa Cruz 15 May (ph. AMR, BBa, RRa). North of S.F., coastal migrants were found at Laguna de Santa Rosa, Sonoma 10 Apr (ScC) and e. of Willow Creek in Humboldt 3 May (Tkz, *Rbf, DCo, Casey Ryan). A pair nestled again in Coyote Valley, Santa Clara, with nest building first observed 8 Apr (RPh, m.ob.).

Black Rails were well reported from Sacramento, with one at Stone Lakes N.W.R. 11-27 Mar (Mark Sawyer, m.ob.), one at Twitchell Island 17 Apr (Iryna Dronova), and up to 3 at C.R.P. 23 May–6 Jun (Breck Breckenridge, Julian Wood, JT, m.ob.). Up to 4 were found at Alviso Marina C.P., Santa Clara 13 Mar–9 May (FV, m.ob.), with additional birds heard along nearby Alviso Slough 14 Apr+ (DwBw, WGB, MMr, MDo); another was heard farther n. at Coyote Hills R.F., Alameda 21 May (Jerry Ting). The Sandhill Crane at the Smith River bottoms, Del Norte was last seen 4 Apr (LW, LPt). Lingering cranes in Humboldt included 2 near Ferndale 25 Apr (TMcK), 2 near McKinleyville 26 Apr (GSL, LPL), and 2 at Cock Robin Island 20 May (ph. Elizabeth Feucht et al.).

SHOREBIRDS

Continued drought resulted in 36-year-record low water levels at Lake Camanche, but this yielded near perfect conditions for shorebirds, particularly on the n. Amador side. In Amador, 5 Snowy Plovers 12 Apr–15 May (TeA, FS, Greg Hemig) may have been the first for the county, as was a Baird’s Sandpiper 25 Apr (TeA, FS, ph. DMr, JCS, JLx et al.). Up to 3 Wilson’s Phalaropes 7-13 May (TeA, ph. DMr, TS, Greg Hemig et al.) and up to 9 Marbled Godwits 21-25 Apr (ph. DMr, JLx et al.) provided the county’s second and third records, respectively. Other notable shorebirds there included 40 Black-bellied Plovers, 4 American Avocets, 2 Black-necked Stilt, one Willet, 28 Whimbrels, 20 Long-billed Curlews, 10 Dunlin, and 3 Red-necked Phalaropes. Both Whimbrel and Long-billed Curlews were also seen in nearby Calaveras. Notable breeding records for American Avocets were obtained in Mendocino, where a pair incubated four eggs 30 Apr+ (SJS, CEV, RfK, m.ob.) and Santa Cruz, where three nests with eggs were found at College Lake 22 Apr–6 May (Gkt et al.). Notable Black Oyster-catchers inside S.F. Bay included 2 in Benicia, Solano 3 & 16 May (Ken Poerner, EPi), a nesting pair at Ballena Bay, Alameda (Vern Nelson, Rj, m.ob.), and Santa Clara’s fourth, at Alviso 14 Apr (Jason St. Pierre) and 25 May+ (MMr, MJM, m.ob.). At least one American Golden-Plover was reported from Lake Earl and Lake Tolowa, Del Norte 21 May–4 Jun (ph. LBr). It was seen associating with a late Pacific Golden-Plover 25 May–4 Jun (ph. LBr).

The wintering Solitary Sandpipers reported last season continued through 9 Apr in Napa, Napa (MBc, m.ob.) and through 8 Apr nw. of Millerton Lake, Madera (Nina Jones, m.ob.). Twenty-one migrant Solitaries reported from ten counties 16 Apr–9 May included Amador’s second, at the Ione W.T.P. 25-26 Apr (TeA, FS, JCS, JLx, Greg Hemig), and a remarkable 5 at the Hayfork W.T.P. 30 Apr–4 May (fewer than five previous Trinity records, all of single birds; JLx, JSL). Humboldt’s twelfth (and second in spring) Hudsonian Godwit graced Clam Beach 25-26 May (Mark Colwell, ph. SMc, David Orluck, Deven Kammerch-Berke, ph. Rbf, m.ob.). Unusual shorebirds near Stratford, Kings included a Red Knot far inland 30 May and the only Stilt Sandpipers reported, up to 2 birds present 2-4 May (both SMy). Rufus were at H.R.S. 18 Apr (Rj) and inland along Os trom Rd., Yuba 28-30 Apr (JLx, JLa, ph. JCS, JSL, *TBed, m.ob.). Single Sanderlings were far inland in Modoc, at Modoc N.W.R. 1 May and along Goose Lake Causeway 2-3 May (both SCR). Four Sanderlings at Alviso 25 May were the latest ever in spring for Santa Clara (ph. MMr, MJM). Besides the Amador bird noted above, Baird’s Sandpipers were found near Kettlemian City, Kings 9 Apr (2 birds, ph. JSy), along Abel Rd., Colusa 15 Apr (JCS), at Llano Seco North Central Valley W.M.A., Butte 19 Apr (Mrg, Matt Forster), and at Colusa N.W.R., Colusa 24 Apr (JCS et al.). Spring Pectoral Sandpipers were found at Humboldt Bay N.W.R., Humboldt 20 Apr (Carrick Rice), Red ding W.T.P., Shasta 24 Apr (Brooke McDonald), and s. of Corcoran, Kings 3 May (ph. SMy). Two of the 3 reported Semipalmated Sandpipers were the fifth and sixth in spring for San Mateo, at Ravenswood Trail, Menlo Park 23-26 Apr (RSth et al., ph. MDeF, Chy) and Pilarcitos Creek mouth, Half Moon Bay 11 May (ph. MDeF, Chy), the third was at Colusa N.W.R., Colusa 24 Apr (*JCS).

This Gull-billed Tern, photographed on the last day of its 26 April–2 May 2015 stay south of Corcoran in Kings County, may have been a returning bird from last summer, which provided Northern California’s second record. Photograph by Mark Stacey.
SKUAS THROUGH SKIMMERS

The only South Polar Skuas reported were off Eureka, Humboldt, with singles on 15 (RFb; SMcA, Mark Colwell et al.) & 21 May (PEL et al.). Long-tailed is the least frequently reported jaeger in spring; singles were off Monterey 6 May (PEL, Gary Nunn, JCS, Monte Taylor et al.), Trinidad Head, Humboldt 13 May (PEL et al.), and Eureka, Humboldt 15 May (RBf; SMcA, Mark Colwell et al.). Nine Scopoli’s Shearwaters were seen on four dates, 7-21 May, between Mendocino and Del Norte. The total of 75 Sabin’s Gulls, mostly alternate ad., between Monterey and Mendocino 20 Mar (JCS, Tom Crabtree et al.) was exceptional for such an early date. A good count of 5400 northbound Bonaparte’s Gulls passed Pigeon Point, San Mateo 14 Apr (RStH). Our only Laughing Gull was an ad. at Half Moon Bay, San Mateo 4-5 May (Aj et al.), while 8 Franklin’s Gulls in six counties 29 Apr–25 May represented a modest showing. Among 3 Mew Gulls lingering in May, the latest was present through the period at Lake Merced, S.F. (m.ob.). Single Lesser Black-backed Gulls, both on 12 Mar, were at Lake Elizabeth, Alameda (ph. Jerry Ting) and Folsom Lake (third or fourth for Placer, RFz). Five Glaucous Gulls were recorded, the latest being at Half Moon Bay, San Mateo 11 May (MDEF, CHy). California’s first Kelp Gull was well documented at Año Nuevo S.R., San Mateo 27 Apr (ph. Bob Siegel), Half Moon Bay, San Mateo 20 May (ph. Aj), and Ft. 24-29 May (ph. Point Blue); the same ad. was thought to be involved in all three appearances. This bird represented the first North American record w. of Colorado. A Gull-billed Tern s. of Concor- dan, Kings 26 Apr–2 May (ph. MSy, m.ob.) may have been the same individual recorded there last May, one at the Pajaro River mouth 16 May (ph. JGa, Nicholas Kronick) was seen in both Santa Cruz and Monterey, providing a first record for each county. The Region had only two prior records. Six Black Terns at Lake Camanche 14-15 May (TEa, TS, Greg Hemig) were seen in both Calaveras and Amador, pro- viding a first or second record for the latter county. The wintering Common Tern at Arcata Marsh, Humboldt lingered through 16 Mar (EE, RBf). Elegant Terns were early, with 2 at Boli- nas Lagoon, Marin 20 Mar (ph. PP), 24 at Terrace Point, Santa Cruz 21 Apr (AMR), and 2 at Mountain View 20 Apr (Jason St. Pierre, Cole Jower), the latter providing the first Apr record for Santa Clara. Black Skimmers included the expected breeders in S.F Bay and migrants in Monterey and Santa Cruz, whereas one at Ocean Beach 10 May (Huc, PfS)ar provided only the fifth S.F. record.

DOVES THROUGH THRUSHES

The Band-tailed Pigeon incursion in the low- lands continued well into spring, highlighted by what may have been Modesto’s first record, involving 2 birds at Tuolumne River R.P., Stanislaus 19 Apr (HMR). The last lowland report of the season was of a single bird at Oroville, Butte 27 May (Carol Anderson). Our only White-winged Dove was at San Mateo, San Mu- teo 28 May (ph. Mike Aicardi). A Great Gray Owl with a broken wing found at Lake Mary near Mammoth Lakes 22 May (fide KNN) pro- vided only the second or third record for Mono. Astounding numbers of Anna’s Humming- birds visited multiple feeders at a residence in Carmel Valley, Monterey during the period, the peak estimate of more than 900 on 30 Apr (PFw), based on timed counts and presumed turnover rates from the literature, recalled densi- ties at certain feeders in the mountains of Ari- zona. This total eclipsed our previous highest one-day estimate of 150 at Springfield, Tulare 6 Sep 1980. A female Costas Hummingbird at Napa 10 Apr (Craig Cummings) established the fifth record of that species for Napa. A total of 38 ad. male Rufous Hummingbirds at Summit Ridge 11 Apr (JGa, AMR, Nicholas Kronick) represented a strong showing for Santa Cruz. Also impressive were 20 ad. males at nearby Loma Prieta Ave. on the Santa Cruz/Santa Clara border 17 Apr (JGa, Kevin Condon, Nicholas Kronick). A high count of 7 Calliope Humming- birds at Summit Ridge 17 Apr (JGa, Nicholas Kronick, m.ob.) more than doubled the previous record of 3 for any spring season in Santa Cruz. Likewise, 10 in Monterey during the pe- riod established a new seasonal high count for that county (fide DR), and 5 at Dinosaur Point Rd. 1 May (MMR, RG, RFu) set a new single-locality high count for Merced.

The fall-winter invasion of Lewis’s and Acorn Woodpeckers fizzled out in spring, with no especially notable numbers or occurrences. A Williamson’s Sapsucker along Hwy. 36 on the Shasta/Trinity border 4 May (JSL) provided the first spring record for Trinity. Although this species may be resident in the ne. portion of the county, this bird was about 100 km sw. of that area. Six Yellow-bellied Sapsuckers in- cluded 5 coastal (one in Marin, 2 in San Mateo, one in Santa Cruz, and one in Monterey) and one inland at O’Neill Forebay, Merced 12 Mar (PDu, FrO), continuing from winter. Similarly, 8 Red-naped Sapsuckers involved 5 coastal and bayside birds (one in Solano, one in Alam- eida, 2 in Santa Clara, and one in Santa Cruz) and 3 inland (2 in Lassen and one in Merced). An unusual movement of Pileated Woodpeck- ers brought one to the Presidio 16 Apr (the third or fourth for S.F.; HuC, BFi, Lkh), 3 to Contra Costa, and 2 to Monterey. All but one occurred within the period of 14-29 Apr; the outlier was one at Lake Anza, Contra Costa 17 May (Christine W). Large numbers of Hammond’s Flycatchers moved through Santa Clara, with 10 reported 3 Apr–23 May (twice the average fide WGB), and Mono, with 39 reported 26 Apr–31 May (a new seasonal high count fide KNN). All but one of Mono’s records of Gray Flycatcher have come from Wild Horse Ridge; one bird there 27 Apr and another there 1 May (ph. MBe) provided the fifth and sixth records for the county. Black Phoebes continue to increase their presence in Lassen, with multiple reports during the sea- son, including from as far e. as Biscar Reservoir and Honey Lake (fide Karb). Typical for the sea- son, 2 Eastern Phoebes were reported: one at Pescadero, San Mateo 9 Mar (Lfi), and another at Bolinas Lagoon, Marin 18 Mar (JsC). So- noma’s first Vermilion Flycatcher was a female along the Santa Rosa Creek trail in Santa Rosa 20 Apr (DgSh). Another at Oasis Ranch 22-23 May (Pjm, AdEm) established the third spring record for Mono. Tropical Kingbirds, most con- tinuing from winter, included one in S.F. 2 in San Mateo, one in Contra Costa, and 2 in Santa Cruz. Scarse anywhere along the Region’s im- mediate coast, a Cassin’s Kingbird stopped in at the lighthouse at Point Reyes N.S., Marin 30 Apr (ph. DsG). Our only Eastern Kingbird vis- ited Ft. 25-27 May (Point Blue).

The most thought-provoking find of the season was a “brown” shrike in Manchester, Mendocino 5 Mar–22 Apr (ph. Alison Cebula, ph. m.ob.) Not clearly a Brown Shrike (Lanius cristatus), lox where there are three previous re- cords for California, this bird most closely re- sembled a Red-backed Shrike (Lanius collu- rio) x Turkestan Shrike (L. phoenicuroides) hybrid (see North American Birds 69: 4-35).
Not only are there no previous records of this hybrid for North America, there are no records of these Old World parent species either. Two Least Bells Vireos were reported: one singing w. of Corcoran, Kings 9-31 May (ph. M5y, ph. m.ob.) and another at Belmont, San Mateo 14 May (RSTh). A total of 25 Warbling Vireos at Pacheco S.P. 9 May (MMR, PDu) represented the largest pulse of migrants of that species ever reported from one location in Merced. Red-eyed Vireo is less than annual in spring, so the total of 4 this spring was remarkable. Singles were at Golden Gate Park, S.F. 9 May (ASH), Putah Creek, Yolo 18 May (AEn), Point Reyes N.S., Martin 28 May (DSg), and Tunitas Creek Rd., San Mateo 29 May (RSTh).

The invasion of Steller’s Jays on the C.V. floor that began last fall continued into May in the n. C.V. with numerous reports from Suter, Yuba, Butte, Glenn, and Tehama (jide BED). Golden-crowned Kinglets nested at the Strbyng Arboturn in Golden Gate Park during the period (m.ob.), apparently for the second consecutive year, representing the first confirmed breeding records for S.F. Six Townsends’s Solitaires were found outside areas of residency during the period, with one in Tehama, 2 in Napa, one in S.F., one in San Mateo, and one in Contra Costa. Small numbers of residual Varied Thrushes from the massive fall-winter invasion lingered in the C.V. and along the coast through spring, with some in Monterey even hanging on into Jun (jide DR).

THRASHERS THROUGH WARBLERS

Our only Gray Catbird report was of a briefly glimpsed bird during a late snowstorm near McGee Creek, Mono 15 May (ADeM). Six out-of-range Sage Thrashers included 4 along the coast, one in the n. C.V., and one at n. Lake Tahoe, Placer. Lapland Longspurs were at Ferndale bottoms, Humboldt 1 Mar (AxL), on Fl. 12 May (Point Blue), and at Lake Tolowa, Del Norte 22 May (LBr). Two Chestnut-sided Longspurs continued from winter on Bear River Ridge, Humboldt through 4 Apr (TKz, m.ob.). An Ovenbird at Charleston Road marsh, Santa Clara was a winter bird that barely continued into spring 1 Mar (AV). Ovenbirds were also in Cottonwood Canyon, Mono 23-26 May (PJm, m.ob.) and on Fl. 24 May+ (Point Blue). A total of 6 Northern Waterthrushes was more than double our average and included a singing bird likely returning for its third spring near Lake Almanor, Plumas 9 May (RDB, CPD). Blue-winged Warblers are reported in our Region at a rate of about one every five years, so the male that landed on a boat 3 km off Moss Landing, Monterey 24 May (Kate Spencer, ph. Don Baccus) was a very good find. All but one of our S.F. Black-and-white Warblers (twice our average) were in coastal or Bay Area counties. The exception was along McGee Creek, Mono 18 May (CMc). A Prothonotary Warbler at Bodega Bay, Sonoma 30 May (Mike Helferton) and 3 Tennessee Warblers at Point Reyes, Marin 29-31 May (Everett Clark, LKh, m.ob.) all arrived just in time to provide late spring records. The Lucy’s Warbler at Bodega Bay, Sonoma 9-14 Mar (DeH, RAR, m.ob.) provided our first spring record since 2009. A Kentucky Warbler at Point Reyes, Marin 28 May sang a bit and even posed briefly for a photograph (ph. DSg). Our only Hooded Warbler was on Fl. 14-16 May (Point Blue). A male American Redstart in Philo, Mendocino 1 Mar–19 Apr (TDB, m.ob.) sang throughout its visit. Our other redstart was a female in a Pacific Grove, Monterey backyard 25-29 May (ph. RC, ph. DR, m.ob.). We averaged more than seven Northern Parula reports in spring and have received no fewer than two for at least the past 25 springs. Therefore, our lone parula at Point Reyes, Marin 30 May (Mary Ann & Mark Butler, Roger Harshaw) marked a season low for the Region. Magnolia Warblers were in Cottonwood Canyon, Mono 24 May (Meg Andrews) and at Pacific Grove, Monterey 27 May (ph. RC, ph. MiR). Three Chestnut-sided Warblers provided our best spring total for this species in more than 25 years, with males at Mendocino Highlands S.P., Mendocino 25 May (M. Gertz), at Willow Glen, Santa Clara 26 May (Brooke Miller, first spring Santa Clara record), and on Fl. 31 May (Point Blue). We tallied 16 Palm Warblers, twice our average, and this included one Yellow Palm Warbler on Fl. 25 Apr (Point Blue). A singing Yellow-throated Warbler in Bodega Bay 27 May (v.d. DR) furnished a first for Sonoma.

SPARROWS THROUGH FINCHES

Two of the season’s 3 Clay-colored Sparrows were in Mono, one at South Tula 1 May (George Chisman) and another at Bridgeport 22 May (KNN, JLD), with a third bird on Fl. 18 Apr (Point Blue). Black-chinned Sparrows are sparsely distributed and irregular breeders in the Region. This spring they continued for the fourth year near Loma Prieta in both Santa Clara and Santa Cruz, with singing birds arriving by 4 Apr (JaA, AMR, m.ob.). In contrast, they have apparently not bred on Mount Diablo, Contra Costa for several years, and this year’s only Black-chinned Sparrow reported there 19 Apr did not remain (LKh, EPI, Jeff Hoppes). Eleven singing Black-chinned Sparrows were along Bear Mountain Rd. in Henry Coe S.P., Santa Clara 16 May (MMR). Two Black-throated Sparrows were at n. Lake Tahoe, Placer 30 Apr–2 May (ScD). A Nelson’s Sparrow continued from winter through 20 Mar at Arrowhead Marsh, Alameda (Mark Rauzon). The season’s latest lingering White-throated Sparrow was at Marina, Monterey until 22 May (SRv). Also continuing from winter were 4 Harris’s Sparrows, each one at Red Bluff, Tehama 18 Mar (M5w), Salmon Creek, Sonoma 10 Apr (LHg), Modesto, Stanislaus 21 Apr (Tom & Anne Myers), and Arcata, Humboldt 30 Apr (GAB). Our winter Rustic Bunting in S.F. continued through 31 Mar (m.ob.).

Eleven Summer Tanagers included a remarkable 3 at Oasis Ranch, Mono 22-23 May (PJM, ADem, CMc). Twenty-two Rose-breasted Grosbeaks provided a good showing, as we average fewer than 14. A Blue Grosbeak was at Spencerville WA. 10 May (ECB, RCD, John Lace), the same location that hosted Nevada’s first last year. Indigo Buntings were present in typical numbers (8 vs. an average of 7), but there was nothing average about an ad. male Painted Bunting at Bridgeport, Mono 20 May (ph. Tim Taylor, Ryan Spaulding). Tricolored Blackbirds are in significant long-term decline in the state, so it was encouraging to receive reports of new or re-colonized breeding locations. Up to 30 Tricoloreds along the Carson River 3-21 May (TEA, LKh, m.ob.) provided Alpines first documented record, a new colony was found 28 Mar near Fall River, Shasta (BScY, KAB, DM), and nesting was confirmed at a site in Potter Valley, Mendocino 8 May (GEC), where the birds have been absent for about 10 years. Orchard Orioles were at the Presido, S.F. 16 Apr (Huc, LKh, BFI), on Fl. 17-18 May (Point Blue), and at Belmont, San Mateo 31 May+ (RSTh, LB). An unexpected Hooded Oriole at n. Lake Tahoe, Ethoroado 7-10 Apr (Bob Sweat, MMY) provided a first for the Lake Tahoe Basin (Ethoroado, Placer, and Nevada). Baltimore Orioles included a bird continuing from winter at San Mateo, S.F. through 6 Mar (Merry Haverman), a male at Capitola, Santa Cruz 8 Apr (Judy Donaldson), and a male and female in different locations in Bodega Bay, Sonoma 26-29 May (RAR, DN, m.ob.). An otter at Westgate Landing C.P., San Joaquin 15-31 May (Pat & Dave Crotz, DGY, JLD, m.ob.) showed clear signs of being a Baltimore x Bullock’s hybrid. A Scott’s Oriole was at Paradise, Mono 4-18 Apr (DHO). The Brambling found in winter in Arcata, Humboldt continued through 12 Mar (Cindy Kuttner). A Cassin’s Finch visited a feeder in S.F 20 Apr (PSar).

Yee, Bob & Carol Yutzy (Shasta). Many more observers are not specifically cited; all are appreciated.

**SUMMER**

Earshore sea surface temperatures were above average in June and near record-high values in July. At South-end Farallon Island, breeding success by most seabird species was about average, despite reduced numbers and a delayed start to breeding. Warm-water conditions are usually associated with reduced seabird breeding success, but strong upwelling in early spring apparently benefited the local food web, which also brought Sooty Shearwaters, Elegant Terns, and Sabine’s Gulls to nearshore areas in unusually large numbers. Notable rarities this season included the continuing Black Vulture, a Curlew Sandpiper, and a Little Stint. Significant breeding records included the southernmost breeding by Harlequin Ducks in North America.

**WATERFOWL THROUGH PELICANS**

Brant inside S.F Bay included 4 at Brooks Island, Contra Costa 27 Jul (LkH, CDu), where they have been fairly regular in recent years, as well as single birds at Aquatic Park, S.F 10 Jul (ph. Carlo Arreglo) and Coyote Point, San Mateo 24-28 Jul (RSTh, AME). Two green-collared Trumpeter Swans from the introduced Oregon population s. of Alturas, Modoc 15 Jul (SCR) provided only the second summer record for the Region, might pairs from that population eventually breed in California? A very late Eurasian Wigeon lingered from spring at Arcata Marsh, Humboldt through 3 Jun (m.ob.). Two female Ring-necked Ducks with about 14 ducklings near Truckee 7 Jul (ph. WGB) were thought to provide the first breeding record for Nevada. A single Hooded Merganser duckling with the female was likely a result of egg dumping. Lesser Scap breasted again at H.R.S., with the first downy young noted 5 Jul (RJR), but no breeding evidence was noted in Santa Clara for the second year in a row. A female Harlequin Duck with 5 ducklings along the San Joaquin River near Balloon Dome 11 Jul (Jan Allison, ph. Kearey Allison) provided only the second breeding record for Madera, and the first in 91 years! This likely constitutes the southernmost breeding location for North America and presumably the world. Unseasonable scoters inside S.F Bay (all in San Mateo) included a White-winged at Redwood City 21 Jun (female; RSTh), another at Coyote Point 29 Jun (male; ph. Gena Zolotar), and a Black at the latter location 5 Jul (male; ph. Warren & Marilyn Regelmann). Unusual far inland, and especially so in summer, an ad. male Red-breasted Merganser stayed at Bridgeport Reservoir, Mono 19 Jun–6 Jul (PJM et al., ph. RCP).

A Red-throated Loon at Lexington Reservoir lingered from spring through 2 Jun (MMR), furnishing Santa Clara with its first summer record. A concentration of 150 Pied-billed Grebes at Clifton Court Forebay 27 Jul (LKH, CDu) provided one of the highest counts ever for Contra Costa. Rare summer Horned Grebes were at Crowley Lake, Mono 15 Jun (CMc), Mountain View, Santa Clara 16 Jun (Jasan Liu), and Eagle Lake, Lassen 28 Jul (DPA). Eared Grebes nested again at H.R.S., where they have bred each year since 1999 (RJR), this is the most regular S.F Bay-area breeding location. In contrast, bayside nesting by Clark’s Grebes has been documented only since 2011. This season, at least three nests were present in a former Mountain View, Santa Clara salt pond 6 Jun (MMR, MMJ, RQJ), including one built on an old hunting blind. A cruise on 12 Jul produced a Hawaiian Petrel off Humboldt and 8 Ashy Storm-Petrels (3 off Del Norte and 5 off Mendocino; Jeff Gilligan, Owen Schmidt). A Manx Shearwater was seen from Moss Beach, San Mateo 31 Jul (RSTh); we average 1-2 each summer. The stable trio of Northern Gannet, Blue-footed Booby, and Brown Booby was once again recorded at FI; a Blue-footed was seen 19-30 Jul, up to 5 Brown Boobies were present throughout the period (with the high of 5 on 4 Jun), and the gannet was observed sporadically both at FI and at Alcatraz Island, S.F (Point Blue, m.ob.). Otherwise, the only booby was a Brown at Half Moon Bay, San Mateo 26 Jun (MDeF). A Brandt’s Cormorant at Miller/Knox R.S. 11 Jul (LkH, CDu) provided Contra Costa’s first summer record since 2008.

American White Pelicans are scarce in most coastal areas; concentrations of 90+ at Bodega Harbor, Sonoma 3 Jun (Len Blumín), 280 at Struve Slough, Santa Cruz 18 Jul (Dsy), and up to 200 at Elkhorn Slough, Monterey throughout the period (m.ob.) were unusually large. One was at Roberts Lake, Monterey 22 Jul (ph. Sln, ph. RC, DR), there are fewer than 10 Monterey Peninsula records. A Brown Pelican at West Sacramento 12 Jun (Aaron Haiman) provided one of few Yolo records.

**BITTEN THROUGH CRANES**

Least Bitterns continued to be reported in above-average numbers. Up to 2 continued at Las Gallinas, Marin through the period (ph. m.ob.), one continued at Campbell Cove, Sonoma through 30 Jun (DN, JLx, m.ob.), up to 3 continued at Yolo Bypass W.A., Yolo 29 Jun–19 Jul (ph. m.ob.), and one was found again at Mather Lake, Sacramento 12 Jun (Phil Lutz). In addition, up to 3 birds were found at Clear Lake 13 Jun–24 Jul (Greg Guisit, Brad Barnwell), the first found in Lake in two years.

Marm’s Black Vulture was seen again over Chimney Rock at PR.N.S. 18 Jul (ph. Carlo Arreglo). Bald Eagles nested at Crystal Springs Reservoir, San Mateo for the third year in a row; successfully raising 2 young this year. An unseasonable Broad-winged Hawk heading n. over PR.N.S. 4 Jun (ph. Dsy) apparently provided the first summer record for the Region. Swainson’s Hawks nested successfully again near the Napa County Airport, Napa (one fledgling at nest 31 Jul; MBE) and along Coyote Creek at Coyote, Santa Clara (one nearly fledged nesting 16-24 Jul; WGB, RPh).

Up to 4 Yellow Rails were found again s. of Eagle Lake, Lassen 7 Jun–4 Jul (m.ob.). Black Rails continued to be found along Alviso.
Slough and at Alviso Marina C.P., Santa Clara, with a high count of 4 detected 4 Jul (SCR). Common Gallinules bred successfully again in Mendocino, with at least 2 young detected at Ukiah 20 Jun (SJS). Young from the first county breeding attempt at the same location in 2012 were thought to have perished when the pond was cleared of all wetland vegetation. A Sandhill Crane was seen again at the Smith River bottoms 2 Jul (Maureen Kevany-Jahn), and another was heard at Tolowa Dunes S.P. 15 Jul (both Del Norte, TKz).

**SHOREBIRDS**

The nesting American Avocets at the Ukiah W.T.P., Mendocino hatched 3 young 3 Jun and remained through 16 Jul (ph. SJS, m.ob.). Notable S.F. Bay Black Oystercatchers continued from spring with 2 at Benicia, Solano 7 Jul (FRo, LPh), up to 6 (including 2 young) at Ballena Bay, Alameda (RJR, m.ob.), and Santa Claras fourth at Alviso through 22 Jun (Bill Pelletier). An alternate-plumaged American Golden-Plover was found at Arcata Bay, Humboldt 27 Jun 14 Jul (ph. *TMCK, EE, ph. RBf, m.ob.). Two alternate-plumaged-golden-plovers there 6 Jul (EE, TMCK) were not identified to species.

Wandering Long-billed Curlews ended up in unusual locations. One at Clear Lake 3 Jul (ph. FHa) was only the sixth for Lake, up to 2 at Boca Reservoir 12-13 Jul (ph. SRS, DBs, m.ob.) provided a rare record for Nevada, and singles made it to F.I. 3 & 14-15 Jul (Point Blue). A Ruddy Turnstone at Clear Lake S.P. 30 Jul (JRW) provided only the second record for Lake, following the first at the same location 14 years earlier. Another far inland near Corcoran, Kings surprisingly lingered 13 Jun 18 Jul (ph. MSy). Reports of white-necked molting ad. male Ruffs retaining long white chest plumes at the Davis Wetlands, Yolo 29 Jun (*LJE, *John Robinson) and near Corcoran, Kings 11 Jul (ph. MSy) probably involved the same bird. Santa Clara’s fourth Curlew Sandpiper was a basic-plumaged bird at Alviso 5 Jul (*MMM). The Region’s fifteenth Little Stint, and second for Kings, remained near Corcoran 11-15 Jul (ph. MSy). Among 26* Semipalmated Sandpipers 30 Jun+ was the third or fourth for Napa, at American Canyon Wetlands 24 Jul (MBBe, ph. Ken Skolnik, m.ob.). Early returning Wilson’s Snipe included a bird at Zmudowski (MBe, ph. Ken Skolnik, m.ob.). Early r

**JAEGERS THROUGH TURNS**

Good counts of 22 Pomarine and 30 Parasitic Jaegers harassed gulls and terns off Pajaro Dunes, Santa Cruz 27 Jul (AMR, NLv). Sabine’s Gulls (about 95% ads.) staged an unprecedented nearshore incursion in Monterey Bay 18 Jul, with high counts of 1575 at Pajaro Dunes, Santa Cruz 27 Jul (AMR, NLv) and 1870 in a 1.75-hour count from Point Pinos, Monterey 28 Jul (BLS, DR, RC). Although water temperat...

**DOVES THROUGH THRUSHES**

Two Band-tailed Pigeons at Orovile, Butte 30 Jun (Carol Anderson) were unexpected at that location and presumably lingered from the fall-spring incursion. Providing the first record for the greater Sacramento Valley; a Common Ground-Dove was discovered at Elk Creek, Glenn 4 Jul (ph. Sarah MacLean). Two Yellow-billed Cuckoos included Del Norte's first at the Smith River 3-4 Jun (TKz, Casey Ryan, ph. LB, ADB) and the third for Arcata Marsh, Humboldt 27 31 Jul (Axl, m.ob.). Short-eared Owls have been found in Mono during the nesting season on a few occasions over the past several decades, suggesting probable breeding. However, 2 fledglings at Mono Lake C.P. 19 Jul (LHg) provided the first confirmed breeding record since 1933.

A total of eight Black Swift nests at Burney Falls, Shasta 20 Jul (EE) was not unusual for this traditional nesting location. What was unusual, however, was that seven nests were visible in one scope view! Each nest contained a large nestling, one of which was being brooded by an adult. White-throated Swifts are scarce in Sierra, so one well-described bird over Sierra County 28 Jun (*RC) was noteworthy. Del Norte’s first Broad-billed Hummingbird (p.a.) visited a Darlingtonia bog at Smith River R.A. 27 Jun (*Casey Ryan, ADB). As most of our records of vagrant hummingbirds come from feeders, this
record is especially notable.

Lewis’s Woodpeckers are scarce anywhere along the immediate coast, where they sometimes occur fall-spring. Therefore, one in Tennessee Valley, Marin 4 Jun (Jeff Kimball, Mark Forney) was completely unexpected. Following last winter’s invasion, Acorn Woodpeckers persisted in S.F. through the period, with at least 4 in Lafayette Park plus 10 or more in Golden Gate Park, where nesting was confirmed 27 Jun (Dylan Hayes), providing the first breeding record for S.F. A Nuttall’s Woodpecker, evidently a post-breeding wanderer, at Doyle, Lassen 23 Jul (Denise Riddle), was in the e. part of the county, well outside areas of normal occurrence for this non-migratory species.

Our only Least Flycatcher was along the Smith River, Del Norte 2-7 Jun (LuB, m.ob.). Likewise, our only Eastern Phoebe was in Del Norte, at the Crescent City Airport 1 Jun (LuB). Eastern Kingbirds were more plentiful, with 8 birds reported, including Siantala’s first at Faith Ranch 14 Jul (ph. Gary Zahm) and two pairs at the traditional breeding site at Blue Lake, Lassen 22 Jul (ph. EE). Other singles were at PR N.S., Marin 8 Jun (Mark Forney), Point Saint George, Del Norte 9 Jun (ADB), and Pescadero Marsh, Son Matto 25 Jun (GrH).

A White-eyed Vireo at Campbell Cove 7-8 Jun (ph. DN, v.t. ESH, m.ob.) furnished the first record for Sonoma. Continuing from spring, the Bell’s Vireo w. of Corcoran, Kings lingered until 7 Jun (MSy), it was the only one reported. Our only Yellow-throated Vireo, a singing male, was found along Virginia Creek, Mono 17 Jun (KNN). Plumbeous Vireos included a remarkable 12 (six pairs on territory) in a small stringer of aspers in Wildrose Canyon, Mono 12 Jun (CMe) and a single bird outside of breeding range at Klamath Glen, Del Norte 14 Jun–29 Jul (LuB, Kbu). Our only Philadelphia Vireo visited PR N.S., Marin 7 Jun (Everett Clark). Five Red-eyed Vireos included singles at Redwood N.P., Humboldt 5 Jun–30 Jul (GSL, LPL, ph., Kbu, CCoG), PR N.S., Marin 7 Jun (Alex Merritt), Cache Creek 8 Jun (YoLo’s fifth, Brent Campos), Klamath Glen, Del Norte 9-13 Jun (LuB, JCS), and Eureka, Humboldt 10 Jun (TWL).

About 10 ad. Purple Martins associating with two occupied nest cavities at the Benny Doon Ecological Reserve throughout the period (AMR, GJS, Craig Fosdick et al.) established the first nesting record for Santa Cruz since 2001. Similarly, a string of sightings in Jul, including that of 2 ads. feeding 2 jvs at Pillar Point Harbor 8 Jul (RSTh), indicated the first successful nesting in the San Mateo portion of the Santa Cruz Mountains in 20 years. Four Swainson’s Thrushes singing along a 3-km stretch of Mono Creek ne. of Edison Lake, Fresno 3 Jul (JTz) suggested probable breeding.

Although this species was thought to have bred widely along the w. slope of the Sierra Nevada historically, there are no specific breeding records for that county.

**THRASHERS THROUGH WARBLERS**

A Gray Catbird was mist-netted at Bolinas, Marin 16 Jun (Renee Cormier), and another was found singing 22 Jun just 16 km n. of Bolinas at White House Pool, Marin (DvH), raising the possibility that one bird was responsible for both observations. An out-of-range Sage Thrasher was at the Crescent City Airport, Del Norte 9 Jun (Sky Lloyd, ph. LuB). Our only Brown Thrasher was photographed at PR N.S. 7 Jun (Mark Butler, ph. Everett Clark). Three of our 4 Ovenbirds were on Fl. 6-21 Jun (Point Blue), the fourth was at PR N.S. 13 Jun (Alex Merritt, ph. Everett Clark, W. Durrell Kapan). Five Black-and-white Warblers, all in coastal or S.F. Bay counties, furnished a typical seasonal total. A Prothonotary Warbler at PR N.S. 11-19 Jun (DFr, ph. Mark Forney) was a good find. A Tennessee Warbler was banded on Fl. 7 Jun (Point Blue), and another was found singing at Campbell Cove, Sonoma 9 Jun (DN, DFr). Hooded Warblers were at PR N.S. 19 Jun (Mark Sawyer) and at H.R.S. 25 Jun (RJR). Eight American Redstarts included 2 inland birds, one at Oro Loma, Fresno 9 Jun (Jsy) and another at Devils Postpile N.M. 19 Jul (ph. Bruce Aidar, Madurai’s third). Eight of 12 Northern Parulas were in Humboldt. A singing male parula provided Lake’s second record at Coeurimn Bay 16 Jun (IRW), and another singer supplied a notable mid-summer record for YoLo, at the Sacramento Bypass 29 Jun (SCH). Five Magnolia Warblers produced a total twice our summer average. A Blackburnian Warbler on Fl. 5 Jun (Point Blue) was our first in summer since 2009. Summer reports of Yellow Warblers on the C.V. floor seem to be increasing, so birds in good riparian habitat at the Sacramento River N.W.R. Pine Creek Unit, Butte 6 Jun (FrO et al.) and Capay Unit, Glenn 15 Jun (MMu) provided encouragement that this species may someday re-colonize this part if its historical range. Seven Chestnut-sided Warblers provided a good showing, as we average fewer than 5 per season. Blackpoll Warblers were at Ardenwood Farm, Alameda 23-24 Jun (Marty Morrow, ES, ph. m.ob.) and on Fl. 4-7 Jul (Point Blue), and our only Palm Warbler was at Campbell Cove, Sonoma 9 Jun (DN, DFr).

**SPARROWS THROUGH BLACKBIRDS**

Wintering Savannah Sparrows often linger into May and begin singing before they leave grassland habitats in the C.V. and other areas in our Region. Records of singing birds (away from the delta/coastal and high Sierra habitats) in late Jun are unusual. Therefore, observations of Savannah Sparrows singing in grassland habitats along the Pajaro River, Santa Cruz 17 Jun (NLv) and at the Sacramento N.W.R., Glenn 27 Jun (Sarah MacLean) are intriguing. A White-throated Sparrow at Petaluma, Sonoma 4 Jul (Sherry Oster) provided a rare late summer record. Other lingering Zonotrichia sparrows included a White-crowned Sparrow along the Pajaro River near the Santa Clara county line, Santa Cruz 17 Jun (NLv) and a Golden-crowned Sparrow on San Bruno Mountain, San Mateo 23 Jun–2 Jul (Doug Allshouse). Summer Tanagers were at Acampo, San Joaquin 5 Jun (DGY et al.), at Ed Levin C.P., Santa Clara 22 Jun (WGB), and at Coyote Creek Field Station, Santa Clara 29 Jul (ph. Josh Scullen). A female Scarlet Tanager at Campbell Cove 1 Jun (ph. DN, PBC) provided Sonoma its first record. A stunning ad. male Scarlet Tanager was at Ardenwood Farm 19-21 Jun (Chingling Tien, ph. Bill Chen, ph. Bob Toleno, m.ob.), only the second of this species for Alameda. Fifteen Rose-breasted Grosbeaks and 5 Indigo Buntings produced totals for both species well below our averages (26 and 11, respectively). A Blue Grosbeak singing along Pescadero Creek, Santa Cruz 3 Jul (AMR) was very close to a known breeding location in Santa Clara, suggesting that this site may yet produce a first confirmed breeding record for Santa Cruz. The Tricolored Blackbirds found in spring along the Carson River, Alpine were still present 3 Jun (Nancy Overholz), unfortunately, we have no later reports and no confirmation that these birds bred.

Cited observers (county/subregional editors in boldface) Ken Able (Lassen), David P Arsenault, Alan D. Barron, Dave A. Bengston, Murray Berner (Napa), William G. Bousman (Santa Clara), Lucas Bruen, Ken Burton, Ria Carratello, Peter B. Colasanti, Daryl Coldren (Humboldt and Del Norte), Chris Conard (Sacramento), Rudy C. Darling (Nevada), Jeff N. Davis (Madera), Malia DeFelice, Bruce E. Deuel (n. C.V. counties), Colin P. Dillingham (Plumas and Sierra), Cedric DuhLake, Leo J. Edson, Alan M. Einsor, Elisa Elias, Rob Fowler (RBF, Humboldt and Del Norte), Dea Freud, Steve Gerow (Santa Cruz), David Hamilton, Steve C. Hampton, John H. Harris (Siantalaus), Garth Harwood, Floyd Hayes, Cliff Hawley, Debbie House, Lisa Hug, Eugene S. Hunn, John E. Hunter (Trinity), Richard G. Jeffers, Logan Kahle (Contra Costa and San Francisco), Robert J. Keiffer (Mendocino), Tony Kurz, Alexandra Lamb, Kimya L. Lambert, Sarah Lane, Robin L. C. Leong (Solano), Tom W. Leskiw, Gary S. Lester, Lauren P. Lester, Nick Levendosky, John Lewis, Jim Lomax, Michael J. Mammoser, Dan J. Maxwell (Marin), Chris
A ridge of high pressure ruled southern California in March, with temperatures well above normal and precipitation well below normal away from the southeastern deserts. Temperatures were only slightly above normal in April, but rainfall was still well below average. By May, temperatures cooled to below average, and although there was above-average rainfall in much of the Region that month, we still headed into summer having experienced a fourth consecutive exceptionally dry rainy season. Offshore, sea surface temperatures were above normal and continuing to warm. Avian highlights were few this season, with a generally lackluster migration and spring vagrant season. Most noteworthy was a Nazca Booby at Anacapa Island in May (only the third to be found north of Mexico), and three Common Black Hawks on the southern deserts in March and April. Lesser but still significant rarities included a Cape May Warbler, a Cassin’s Sparrow, and an unprecedented early April Mississippi Kite.

**Abbreviations** (both reports): C.L. (China Lake Naval Air Weapons Station, extreme ne. Kern); E.A.F.B. (Edwards A.F.B., se. Kern); F.C.R. (Furnace Creek Ranch, Death Valley N.P., Inyo); G.H.P. (Galileo Hill Park in extreme e. Kern), N.E.S.S. (n. end of the Salton Sea, Riverside); P.M.N.A.S. (Point Mugu Naval Air Station, Ventura); P.P. (Piute Ponds on Edwards A.F.B., ne. Los Angeles); S.E.S.S. (s. end of the Salton Sea, Imperial), S.F.K.R.P. (South Fork Kern River Preserve near Weldon, Kern); S.J.W.A. (San Jacinto Wildlife Area near Lakeview, Riverside); V.C.G.P. (Ventura County Game Preserve near Point Mugu Naval Air Station, Ventura). Because most rarities in s. California are seen by multiple observers, only the observer(s) initially finding and/or identifying the bird are included. Documentation for species on the California Bird Records Committee review list (see www.californiabirds.org) is forwarded to the committee and archived at the Western Foundation of Vertebrate Zoology in Camarillo.

**WATERFOWL THROUGH HERONS**

Each spring, migrant waterbirds wintering in the Gulf of California follow a non-stop route that takes them northwestward across the Anza Borrego Desert and the lower parts of the Laguna Mountains to the Pacific, probably across Los Angeles, as suggested by 40 Brant flying westward over El Monte 12 Apr (LSC), stopping only when forced to the ground by storms. Flocks of 45 Brant on Fig Lagoon near Seeley, Imperial 11 Apr (GmCc) and 15 on Lake Henshaw, San Diego 21 Mar (RA), along with up to 10 together at multiple locations at the Salton Sink, Imperial/Riverside, and the general area around Borrego Springs, San Diego between 28 Mar and 20 May, were all such storm-grounded birds. However, 4 at Bishop, Inyo 21 May (JJB) had erroneously followed a more easterly route that placed them on the e. side of the Sierra Nevada. The latest of the wintering Eurasian Wigeons were single birds at Kern N.W.R., Kern through 18 Apr (AMS), the S.J.W.A. through 26 Apr (CmCc), and at Hansen Dam, Los Angeles through 29 Apr (JR). Long-staying Harlequins Ducks at Estero Bluffs S.P., San Luis Obispo through 30 May (TME) and at Avila Beach, San Luis Obispo through 16 May (JCop) were expected to remain through the summer. Single Surf Scoters at Borrego Springs 8 Apr (PA) and on the Salton Sea at Salt Creek 23 Apr (RmCc) and a White-winged Scoter at Lancaster, Los Angeles 24 Apr–4 May (CH) were inland, where rare, but much rarer was a Black Scoter at Borrego Springs 8 Mar (PA). In addition, the total of 15 Black Scoters along the coast of San Luis Obispo was far more than expected, with the latest being one near Cayucos 25-30 May (TME). A Long-tailed Duck was inland at Desert Center, Riverside 13-14 Mar (BS), and another at Kern N.W.R. 14-25 Mar (BoC) was only the fourth to be found in Kern, on the coast, single birds were at Morro Bay, San Luis Obispo 21 Mar–20 May (JM) and Pismo Beach, San Luis Obispo 2-9 May (F&JC).

A Sooty Grouse at Silver Canyon 10 Apr (SLS) was in the White Mountains, Inyo, where few have been reported in recent years. Single Pacific Loons on hesperia, San Bernardino 2-22 May (MwO), at N.E.S.S. 10 (CmCc) & 29 Mar (CmCc), at Borrego Springs 23 Apr–1 May (Wth), and at Fig Lagoon 11 Apr (GmCc) were all well inland, where rare. A Red-necked Grebe on the coast at PM.N.A.S. 20 Mar (Dpe) was the only one reported. A Laysan Albatross at the 9-Mile Bank off San Diego 3 & 16 May (Dpe) was only the third live bird ever recorded in San Diego waters. A Laysan Albatross was captured well inland at a construction site in Palm Desert, Riverside 20 Mar and taken to San Pedro for treatment and release. Noteworthy procellarids reported by PEL from cruise-
